NOTICE: This sequence may not be the entire insert of this clone It may be shorter because we only sequence overlapping sections once, or longer because we provide a small overlap between neighboring submissions

all regions were double stranded, sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by This sequence was finished as follows unless otherwise noted: sequence from more than one m13 subclone

NOTES:

FEATURES

Coding sequences below are predicted from computer analysis, using the program Genefinder(P. Green and L. Hillier; as in preparation). Location/Qualifiers 1. .81877

Submitted (05-JAN-2001) Plant Gene Expression Center, 800 Buchanan Street, Albany, CA 94710, USA On Jan 5, 2001 this sequence version replaced gi:4558586. This sequence is of BAC T518 from Arabidopsis thallana chromosome 1. In order to facilitate the joining of overlapping clones in the future for creation of larger contigs, we provide a overlap between overlapping submitted clones. The 3' end of this sequence overlaps by 1000 bp the 5' end of the sequence of the BAC T17H7.                                                                                     Conservative
                                                                                                                                                                                      from Arabidopsis thaliana, Columbia Col-0, at 4 - 7
weeks. Plants were grown in 1:1:1 peat
moss/vermiculite/perlite soil at 22 deg. C +/- 3 deg. C
under constant light, and watered with fertilizer. cDNA
synthesis was initiated using a NotI-oligo(dT) primer.
Double-stranded cDNA was blunted, ligated to SalI adaptors
, digested with NotI, size-selected, and cloned into the
NotI and SalI sites of the pSPORT vector."

An Arabidopsis full-length CNNA library was constructed essentially
as reported previously (Seki et al., 1998). This clone is in a
modified pBluescript vector as a SstI/XhoI insert. Please visit our
web site (http://www.gsc.riken.go.jp/e/plant/index _e.html) for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RIKEN Genomic Sciences Center

An Arabidopsis full-length cDNA library was constructed essentially
as reported previously (Seki et al., 1998). cDNA cleaved with BamHI
and XhoI was ligated to modified Lambda FLC-1 vector (Carninci et
al., submitted for publication) digested with BamHI and SalI. This
clone is in a modified pBluescript vector. Please visit our web
site (http://www.gsc.riken.go.jp/e/plant/index _e.html) for further
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RIKEN Genomic Sciences Center 3-1-1 Koyadai, Tsukuba, Ibara Tel: 81-298-36-4359

An Arabidopsis full-length cDNA library was constructed essentially
as reported previously (Seki et al., 1998). This clone is in a
modified pBluescript vector as a SstI/XhoI insert. Please visit our
web site (http://www.gsc.riken.go.jp/e/plant/index _e.html) for
                                                                                                                                                                                                                                                                                                                                                                 Plant

An Arabidopsis full-length cDNA library was constructed essentially
as reported previously (Seki et al., 1998). cDNA cleaved with BamHI
and XhoI was ligated to modified Lambda FLC-1 vector (Carninci et
al., submitted for publication) digested with BamHI and SalI. This
clone is in a modified pBluescript vector. Please visit our web

/dev_stage="3 day-old mRNA from 3 day-old arabidopsis thaliana (Columbia) seedling hypocotyls as template and oligo d(t) as primer, first strand synthesis was catalyzed by Moloney murine leukemia virus reverse transcriptase (Pharmacia). Second-strand cDNA was made using the procedure of Gubler and Hoffman (1983) except that DNA ligase was omitted. After the second strand reaction, the ends of the cDNA were made blunt with Klenow fragment and EcoRI/NotI adapters (Pharmacia) were ligated adapters by spun-column chromatography using sephacryl s-300 and size-fractionated on a 1% low melting point mini-gel. Size selected cDNAs (3 - 6 kb) were removed from the gel using agarase (New England Biolabs), phenol:choloroform extracted and precipitated with lug of lamidazen (Ph 7)/ethanol. A portion of each cDNA size-fraction (0.1 ug) was co-precipitated with lug of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                22313tcn@ibm.cl.msu.edu
               lambdaZapII (StratageneEcoRI digested, dephosphorylated arms and then ligated in a volume of 4 ul overnight. Each ligation mix was packaged in vitro using Gigapack II gold packaging extract (Stratagene). We have determined that although first strand cDNA synthesis was initiated using dT, almost all of the cDNAs begin 8-10 bp from the poly-A

!:
       Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                       194.4
